CP31, CP31D, CP32D circuit protectors

250V AC 0.3A to 30A
50V DC 0.3A to 30A

Description

The CP31 and CP32 have a similar functions to a molded case circuit breaker and they can be used for normal switching ON and OFF operations while breaking both overload and short-circuit currents. They are available in two time-current versions—an instantaneous and a time-delay version. A suitable type should be selected to match the thermal and permissible current requirements. These are recommended for sequential control circuits, motor control circuits, solenoid-operated valves, heaters and solid-state applications.

Features

- Excellent arc interruption
Since the arc extinguisher uses a loop blow-out system the arc is rapidly extinguished.
- Highly visible handle indication ON shows red and OFF or TRIP blue.
- When positioned at ON the operating handle is completely housed inside the molded case and does not protrude.
This helps to prevent erroneous operation.
- Trip-free mechanism
- Also available with auxiliary switch SPDT.
- Two time-current versions—
instantaneous operation and a time delay type. Select the model best suited to your protection needs.
- CP31D and CP32D types are of front and rail dual mounting.

Typical applications

These CP31 and CP32 protectors are used for normal on-off switching of the power supply while also providing overload protection of the load circuits.

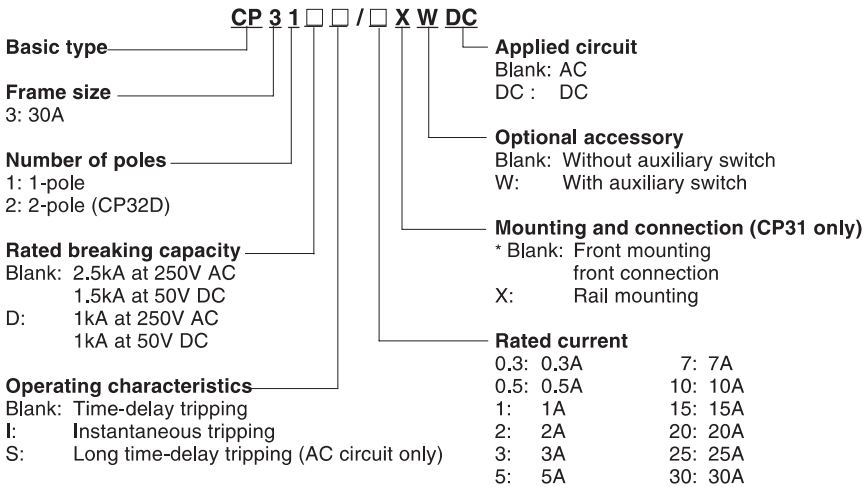

Time-delay tripping type

- Control circuits
- Solenoid valves and motor circuits
- Heater circuits

Instantaneous tripping type

- Semiconductor circuits
- SCR (Silicon controlled rectifier) and triac circuits
- Computer peripheral equipment

Type number nomenclature

* One and the same CP31D and CP32D can be used for both front mounting and rail mounting.

Circuit Protectors CP31, CP31D, CP32D

■ Operation

The operation of the magnetic overload release of the CP31, CP31D and CP32D circuit protectors are as shown in the sectional diagram Fig. 1. The magnetic tripping element of the circuit protector is simple—a solenoid coil wound around a hermetically-sealed non-magnetic cylinder containing a spring-loaded movable iron core and a silicon fluid. When currents less than the rated value flow no movement occurs in either the armature or iron core. However, when a sustained overcurrent occurs the magnetic field is increased. This causes the iron core to move along the cylinder. Once the core reaches the opposite end of the cylinder the armature is attracted which causes the protector to trip as shown in Fig. 2 and 3. When a short circuit occurs the magnetic flux produced in the coil alone is strong enough to attract the armature regardless of core position. This causes circuit to be interrupted instantaneously.
